

# Vampire Facelift

Your blood has never been put to better use as it would be in the new cosmetic enhancement treatment which is called Vampire facelifts. Blood transfusion is known to infuse fresh life and growth amongst the cells in the body and is popular for treating other organs, illnesses, ailments and disorders in the body. In the case of cosmetic development it is every cosmetic surgeons endeavour to find newer, better solutions which are pain-free for their patients and the new age replacement to Botox, vampire facelift is the current and fast becoming youth-defying mantra. This procedure involves injecting the patient's own blood to fill out and smoothen the wrinkles and hollows on the face. The blood is drawn from the patients arm. The platelets are then spun out using a selphyl-brand centrifuge. This platelet rich fibrin template is then injected into the face.

Dr Satish Bhatia, M.D. one of Mumbai's finest and most dynamic Cosmetic Surgeon says "this is less invasive than a face-lift and a safe procedure which involves an in-clinic cosmetic procedure." Dr Bhatia has been performing this procedure for some time now and has found exceptionally good results. This procedure is considered completely safe and has a natural advantage over synthetic fillers since the Selphyl involves injecting the patient with something that is part of their body and not a foreign substance.

For the not so faint-hearted and adventurous, do pick up the phone and get detailed information on this new age procedure at :
